Application Programming Interface (API)

Definition of attributes

- **host:** available for external application users (reports submitters) with a configured hostname. A valid access token is expected for each request (variable type: *String*).
- **data_collection_id:** optional string representing the data collection id as set in the Data Collection System (variable type: *String*).
- **latestProcessingId:** the ID of the latest submission (variable type: *String*).
- **submissionId:** the ID of the submission being processed (variable type: *String*).

Steps for API workflow

1. Login (authentication/authorisation):

- Endpoint: <https://sso-dev.lb.it/auth/realms/abacus360/protocol/openid-connect/token>.
- Access token must be added for all API requests.

2. Report submission (data collection):

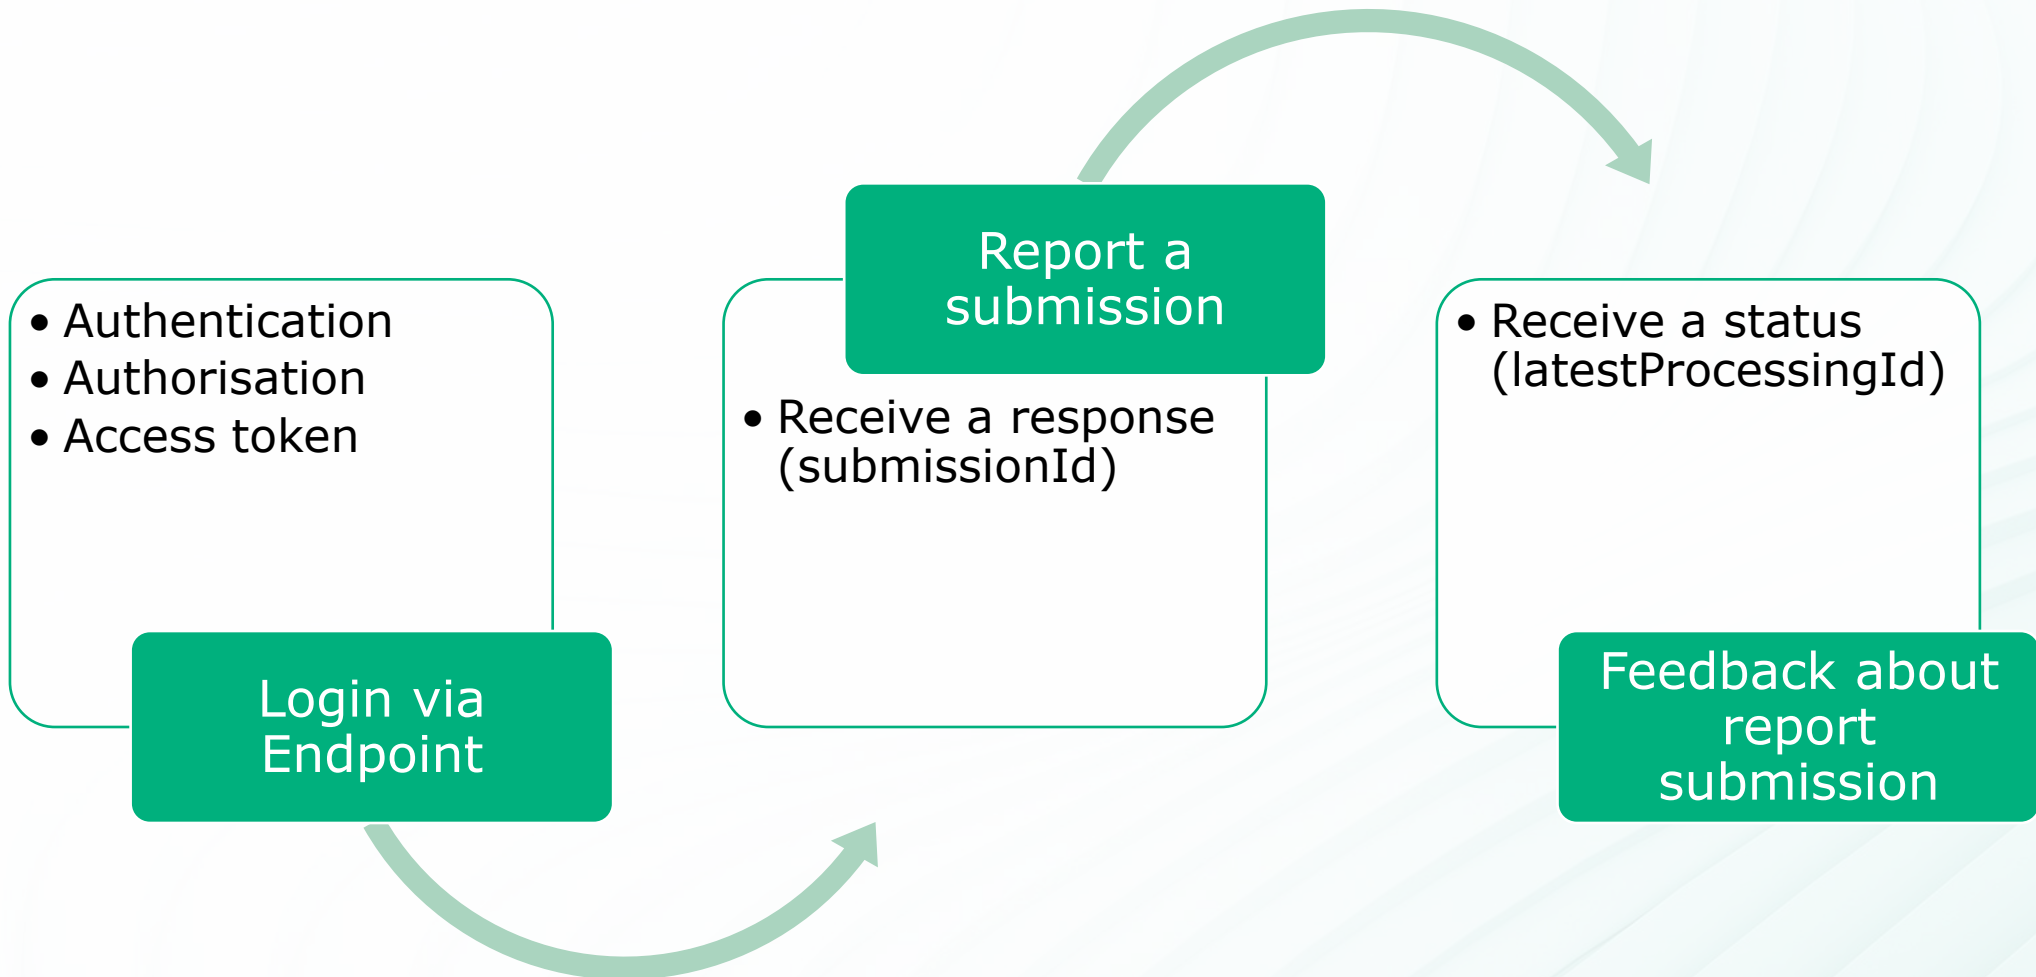

- Link for a general report submission structure: https://regata-test.lb.it/api/v1/submissions/{data_collection_id}.
- Link for an EBA ITS CRD IV directive submission (**data_collection_id** = "std-eu-ebaxbrl"): <https://regata-test.lb.it/api/v1/submissions/std-eu-ebaxbrl>.
- Attribute **submissionId** is a response from an API query.

3. Feedback information about report submission:

- General object properties use **submissionId** (from a previous query): <https://regata-test.lb.it/api/v1/graphql>.
- **latestProcessingId** attribute has to be used in order to receive the status of the last previous query (e.g. https://regata-test.lb.it/api/v1/graphql/processings/{latestProcessingId}/validation_problems).
